# The optical print image monitoring as a possibility for inspection

For our pad printing machines we now offer optical print image monitoring to avoid unnecessary costs and waste in your manufacturing process. It enables easy control of the printing results with an actual image, captured by camera, which is positioned over the loading / unloading station.

The operator can act immediately even before drying is completed and adjust the printing process. The LCD monitor shows an enlarged view of the actual printed image and can be located up to 5 m from the camera.

This optical print image monitoring is a cost-effective alternative to fully automatic vision systems.

We deliver the complete camera monitoring system for the inspection of your printed images.
